

Safety LifeSavers

Safety LifeSavers are essential safe work practices designed to protect you and others from serious injury or death.

To safely perform the work including operating equipment, you must have the necessary qualifications, certificates, competencies and training.

Before you start, make sure you plan the job and all members of the work team understand their roles and responsibilities. A Job Risk Assessment must be completed for all operational jobs.

Always wear the appropriate personal protective equipment and clothing at the work site and for the job.

Comply with all the requirements of working at heights when using equipment such as a ladder, harness, lanyard or scaffold.

Provide adequate control to manage site hazards, excavations, traffic and public safety.

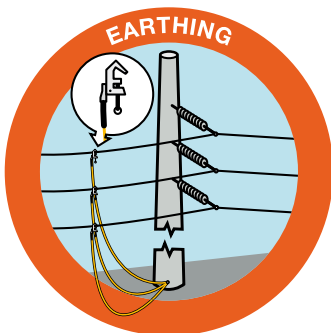

Test before you touch. Treat all conductors as live until YOU prove they are de-energised and made dead. Confirm your work and follow the correct work instructions.

The relevant permits or programs must be issued before work starts. Make sure the correct isolations are made and the proper tags are used for the job.

Use the approved insulating mats and covers to prevent accidental contact.

Apply appropriate earthing where required. Use visible earths in the work area.

Always drive safely, obey traffic laws, secure loads and conduct regular safety checks.

Think Safe Work Safe Live Safe

Breach of Safety LifeSavers or concealing breaches can result in disciplinary action and may lead to termination of employment.
