

sustainability policy

Western Power will work with its stakeholders including the broader community, to deliver energy solutions for a sustainable future.

To Western Power, sustainability means meeting the needs of current and future generations by considering environmental protection, social advancement, and economic prosperity in our business activities and decisions.

Western Power recognises the dependent nature of the sustainability themes and the need for a holistic response to the urgent challenges of sustainability. We are therefore committed to embed a sustainability framework and capability that assists in delivering strong business outcomes and meeting the long term energy needs for Western Australia.

PRINCIPLES

Sustainability is a key driver of Western Power's strategic direction to work with the community to deliver sustainable energy solutions for the future.

Western Power has adopted the following principles to achieve its commitment to sustainability and long-term business objectives:

Leadership & culture

Drive a sustainability focus based on a culture of achievement, customer awareness, responsibility and innovation.

Conduct work in a manner where people are free from injury and harm.

Enhance the capacity of employees to respond to the challenges of sustainability through training and awareness.

Sustainability initiatives and outcomes

Plan and conduct business activities to reduce our environmental footprint beyond mere compliance with legislative requirements.

Optimise resource usage and reduce waste, by applying a total life-cycle philosophy to our business inputs.

Facilitate the delivery of renewables across the network and support research, development and commercialisation of sustainable energy practices.

Proactively engage with our stakeholders and the communities in which we operate to achieve sustainable energy solutions for them.

Provide education to the community to raise awareness of sustainability issues and support energy efficient behaviour.

Embrace the principle that everyone has the right to access a reliable power supply, through processes that are equitable and transparent.

Influence sustainable energy policy at State and National levels.

Governance and accountability

Govern the business ethically as set out in our code of conduct and aspire to do more than just comply with our legislative obligations.

Align our commitment to sustainability with our business strategy and regulatory environment.

Enhance the long-term value of the business to the community.

Annually report on the extent to which we have achieved the desired sustainability outcomes to our stakeholders, including the community.
